

Release Notes Studio Ubuntu 8.04

Ubuntu 8.04 default screen keyboard

The default Ubuntu 8.04 screen keyboard, used by mimio in Studio Linux 6, is not functioning properly. To workaround the issue, please install the xvkbd application, (instructions below.) This application has been verified to work properly on Ubuntu 8.04. In addition, if the software has been properly registered, the Writing Pad utility should function properly independent of the keyboard utility being used.

To install xvkbd on Ubuntu 8.04:

Option 1:

1. Open a terminal window (Applications->Accessories->Terminal)
2. Type "sudo apt-get install xvkbd"

Option 2:

1. Open the Synaptic Package Manager (System->Administration->Synaptic Package Manager)
2. Click on the Search button and enter xvkbd
3. Right-click on the xvkbd entry returned by the search and select "Mark for Installation"
4. Click on the Apply button to complete the install

Note: The user will need an account on the machine that has install privileges.
